"The S. cerevisiae SET3 complex includes two histone deacetylases,
Hos2 and Hstl, and is a meiotic-specific repressor of the sporulation
gene program.";
                                                                                                                                                                                                                                                                                                                          gene program.";
Genes Dev. 15:2991-3004(2001).
-!- FUNCTION: Part of the Set2C complex, which is required to repress
early/middle sporulation genes during meiosis.
-!- SUBUNIT: Identified in a Set3C complex with SET3, HST1, HOS2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

I DOMAIN: C2 domain 1 is involved in binding calcium and phospholipids. Calcium binds with low affinity but with high specificity and induces a large conformational change.

SIMILARITY: Contains 2 C2 domains.

SIMILARITY: Contains 1 PDZ/DHR domain.
-i. FUNCTION: May act as a scaffolding protein involved in the organization of synaptic active zones and in synaptic vesicle trafficking (By similarity).
-i. SUBUNI: Interacts with Rabacl/Pral, RIMS2 and profilin (By similarity).
-i. SUBCELLULAR LOCATION: Concentrated at the presynaptic side of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GO; GO:0005856; C:cytoskeleton; NAS.

DOMAIN: Has a highly basic region with many copies of the sequence KKEs and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

PTM: LCI is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteolytic processing. It is free to associate with both MAPIB and MAPIB. It interacts with the amino-terminal region of MAPIB (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1995 (Rel. 32, Created)

                                                                                                                                                                                                                                                                                                        J. Cell Biol. 147:151-162(1999).

-!- FUNCTION: May act as a scaffolding protein involved in the organization of synaptic active zones and in synaptic vesicle trafficking (By similarity).

-!- SUBUNIT: Interacts with Rabacl/Pral and profilin (By similarity).

-!- SUBCELLULAR LOCATION: Concentraced at the presynaptic side of
                                                                                                                      Gallus gallus (Chicken).

                                                                                                                                                                                                                                                                                                                                                                                 synaptic junctions (By similarity)
-!- DOMAIN: C2 domain 1 is involved in binding calcium and phospholipids. Calcium binds with low affinity but with high specificity and induces a large conformational change.
-!- SIMILARITY: Contains 2 C2 domains.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.
                                                                                                                                                                                                                    MEDLINE=59439764; PubMed=10508862; MapLine B., Petrasch-Parwez B., Killmann M.W.;

In decrease during postnatal development and are low in adults. In dorsal root ganglia levels remain high throughout development.

INDUCTION: By nerve growth factor.

INDUCTION: By nerve growth factor with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

"The Shank family of scaffold proteins.";
J. Cell Sci. 113:1851-1856(200)
J. Cell Sci. 113:1851-1856 an adapter protein in the postsynaptic
-!- FUNCTION: Seems to be an adapter protein in the postsynaptic
density (PSD) of excitatory synapses that interconnects receptors
of the postsynaptic membrane including NMDA-type and metabotropic
glutamate receptors via complexes with GKAP/PSD-95 and Homer,
respectively, and the actin-based cytoskeleton. May play a role in
the structural and functional organization of the dendritic spine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and synaptic junction.
SUBUNIT: May homomultimerize via its SAM domain (By similarity).
Interacts with SSTR2 C-terminus via the PDZ domain. Interacts with SPTAN1, Homer-1 and DLGAP1/GKAP isoforms 1 and 2 (By similarity).
Is part of a complex with DLG4/PSD-95 and DLGAP1/GKAP (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                              SHAI HUMAN STANDARD; PRT; 2161 AA.

-!- TISSUE SPECIFICITY: Expressed in brain particularly in the amyddala, hispocampus, substantia nigra and thalamus. Isoform seems to be expressed ubiquitously.
-!- SIMILARITY: BELONGS TO THE SHANK FAMILY.
-!- SIMILARITY: Contains 6 ANK repeats.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.
-!- SIMILARITY: Contains 1 sterile alpha motif (SAM) domain.
-!- SIMILARITY: Contains 1 sterile alpha motif.
SUBCELLULAR LOCATION: Cytoplasmic; postsynaptic density

SUBUNIT: Belongs to the ASC-2/NCOA6 complex (ASCOM), which
contains ASC-2/NCOA6, the retinoblastoma-binding protein RBQ-3/
RBBPS, alpha- and beta-tubulins, the trithorax group proteins MLL2
and MLL3, and ASH2/ASCL2. Interacts with histone H3 (By
              MLL3 MOUSE STANDARD; PRT; 4903 AA.
QBBRH4, QBBK12; QBC6M3; Q923H5; Q923H6;
10-OCT-2003 (Rel. 42, Last sequence update)
15-MAR-2004 (Rel. 43, Last amoutation update)
Myeloid/lymphoid or mixed-lineage leukemia protein 3 homolog (Histonelysine N-methyltransferase, H3 lysine-4 specific MLL3) (EC 2.1.1.43).
                                                                                                                                                                                                                                                                                                                        Tan Y.C., Chow V.T.;

"Novel human HALR (WLL3) gene encodes a protein homologous to ALR and to ALL-1 involved in leukemia, and maps to chromosome 7q36 associated with leukemia and developmental defects.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine =

ROJENCE OF 1151-3703 FROM N.A.

Kozlowicz A., McQuerry Y., Hotic M.;

Submitted (UUN-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Transcriptional activator that binds to the AT-rich sequence of the enhancer element of the AFP gene.

-!- SUBUNT: Interacts with FNBP3 (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear.

-!- ALTERNATIVE PRODUCTS:

Event=Alternative splicing; Named isoforms=2; Name=A;

-!- DISEASE: Defects in TCOP1 are the cause of Treacher Collins syndrome (TCS) [MIM:154500]. TCS is an autosomal dominant disorder of craniofacial development that occurs with an incidence of 1/50,000 live births. The clinical features of TCS are bilaterally symmetrical and include: (1) abnormalities of the external ears, atreata of the external ear canals, and malformation of the middle ear ossicles, which may result in conductive hearing loss; (2) lateral downward sloping of palpebral fissures, frequently with colbomas of the lower eyellds; (3) hypoplasia of the mandible and zygomatic complex; (4) cleft palate.

-!- SIMILARITY: Contains 1 Lish domain.

PTM: Phosphorylated at multiple sites by different protein kinases and each phosphorylation event regulates the protein's structure and function (Potential).

SIMILARITY: Contains 1 death domain.
                                                                                                                                                                                                                                                                                                TISSUE=Brain stem;

rance-3; syloupus-13; Sequence=VSP 001171; collagens are colocalized and present only in basement membranes of kidney, eye, colocalized and present only in basement membranes of kidney, eye, cochlea, lung and brain.

-!- DOMAIN: Alpha chains of type IV collagen have a noncollagenous domain (NCI) at their C-terminus, frequent interruptions of the G-X-Y repeats in the long central triple-helical domain (which may cause flexibility in the triple helical domain (which may cause flexibility in the triple helix), and a short N-terminal triple-helical 7S domain.

-!- FTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

-!- FTM: Type IV collagens contain numerous cysteine residues which are involved in inter- and intramolecular disulfide bonding. 12 of these, located in the NCI domain, are conserved in all known type IV. collagens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PTM: Phosphorylated by the Goodpasture antigen-binding protein. DISEASE: Antibodies against the NC1 domain of alpha3 (IV) mediate the autoimmune disease Goodpasture syndrome [MIM:23450], which is characterized by hematuria and pulmonary hemorrhage. DISEASE: Defects in COL4A3 are a cause of autosomal recessive Alport syndrome (AS) [MIM:203780], an hereditary disorder characterized by progressive glomerulonephritis, renal failure, hematuria, ocular abnormalities and deafness. The recessive form occurs equally between males and females.
                                                                                                              nidogen.
SUBUNIT: There are six type IV collagen isoforms, alpha 1(IV)-
alpha 6(IV), each of which can form a triple helix structure with
2 other chains to generate type IV collagen network.
SUBGELIULAR LOCATION: Cell surface (Potential).

Predominant neuronal expression of the gene responsible for dentatorubral-pallidoluysian atrophy (DRPLA) in rat.";
Hum. MOI. Genet. 4:1619-1624(1995).
-!- SUBUNIT: Interacts with WWP1 and WWP2 (By similarity).
-!- TISSUE SPECIFICITY: Predominant neuronal expression, although markedly reduced amounts are found in most other tissues.
-!- DEVELOPMENTAL STAGE: Similar expression at all development stages (14.5 dpc, 17.5 dpc, newborns and adults).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TGONGPKPPATLGADGPPPGPPTPPRRTSRAPIEPTPASEATGAPTPPPAPPSPSAPPPV
